Policy Discussion – Heavy-Duty Truck Fuel Economy

Presentation by Drew Kodjak, National Commission on Energy Policy

10th Diesel Engine Emissions Reduction (DEER) Conference August 29 - September 2, 2004
Coronado, California
What is the NCEP?

- Bi-partisan group of 17 experts from academia, government, industry, labor, consumer protection and environment.
- Seek to combine academic credibility and political immediacy.
Commissioners
Commissioners

John P. Holdren  
*Co-Chair*  
Teresa and John Heinz Prof. of Environmental Policy, Harvard University

William K. Reilly  
*Co-Chair*  
President and CEO of Aqua International Partners, Chairman of the World Wildlife Fund, and former Administrator, U.S. EPA

John W. Rowe  
*Co-Chair*  
Chairman and CEO, Exelon Corporation

Philip R. Sharp  
*Congressional Chair*  
Senior Advisor, Lexecon, Inc.; Former U.S. Representative, Indiana

Marilyn Brown  
Director, Energy Efficiency and Renewable Energy Program, Oak Ridge National Labs

Ralph Cavanagh  
Senior Attorney and Co-Director of Energy Program, Natural Resources Defense Council

Archie W. Dunham  
Chairman and CEO, Conoco, Inc.

Rodney Ellis  
State Senator, Texas

Leo Gerard  
International President, United Steelworkers of America

F. Henry Habicht  
CEO, Global Environment and Technology Foundation, Former Deputy Administrator, Environmental Protection Agency

Andrew Lundquist  
President, The Lundquist Group, and former Executive Director, National Energy Policy Development, The White House

Mario J. Molina  
Institute Professor, Massachusetts Institute of Technology

Sharon L. Nelson  
Senior Assistant Attorney General, Consumer Protection Division, Washington Attorney General’s Office and Chair, Board of Directors, Consumers Union

Linda Stuntz  
Partner, Stuntz, Davis & Staffier, Former Deputy Secretary of Energy

Susan Tierney  
Senior Vice President, Lexecon, Inc., former Assistant Secretary of Energy

James Woolsey  
Vice President, Booz, Allen, Hamilton; former Director of the Central Intelligence Agency

Martin B. Zimmerman  
Group Vice President, Corporate Affairs, Ford Motor Company
Policy Goals

• Adequate supply of energy
• Environment
• Oil Security
2000 CO₂ Emissions from Fossil Fuel Combustion by Sector and Fuel Type

Note: Electricity Generation also includes emissions of less than 0.01 Tg CO₂ Eq. from geothermal plants.
Climate Change

• Century-scale, global problem characterized by uncertainty about both the costs and benefits of mitigation.

• Commission goal to establish a policy architecture that can evolve along with our understanding of the problem, the range of possible solutions, and the prospects for collaboration with other nations.
Models suggest that the transportation sector will be largely unaffected by efforts to stabilize global carbon emission.

Oil Security

• NCEP definition includes (1) Ensuring adequacy of supply and (2) Lowering risks from oil supply disruptions.
  – Global oil consumption projected to increase from 78 MBD today to 118 MBD in 2025.

• Where to find 40 MBD?
  – Domestic supplies on the decline.
  – Non-petroleum fuels may provide 500K BD by 2025.
  – Fuel economy improvements could generate 2 to 5 MBD by 2025.
Efficiency potential is large, although these estimates do not account for tradeoffs with safety/performance.
List of fuel economy benefits . . . .

- Reduces pressure on future oil production
- Insulates U.S. economy from oil price shocks
- Helps lower carbon emissions.
- Lays groundwork for alternative fuel vehicles.
  - Hydrogen fuel cell vehicles are challenged by low energy density of hydrogen gas.
  - Ethanol from plants is challenged by land use constraints.
How future debates might influence transportation policy...

- Climate Change -- Most likely climate change policy option is an economy-wide, cap and trade program. Such a program would have a significant impact on the coal sector, and almost no impact on the transportation sector, which is the second largest source of CO2 emissions. Pressure likely from the electric utility / coal industry for the vehicle industry to “do its fair share” to address climate change.

- Oil Security -- What can the U.S. – the world’s largest consumer of oil by a factor of 4 – do to help global production meet future demand in 2025? Best domestic option -- we can establish policies to increase fuel economy of passenger vehicles and heavy-duty vehicles.
What about heavy-duty trucks

• Economic incentive for manufacturers to produce highly-efficient vehicles.

• But fuel economy at 20 year low for tractor-trailers.

• And existing and emerging fuel economy technologies could be installed that would pay for themselves over the lifetime of the vehicles.

• What’s the best course of action?
Energy Use by Truck Type

- Class 3: 3%
- Class 4: 1%
- Class 5: 1%
- Class 6: 14%
- Class 7 & 8: 81%

- Straight truck: 12%
- Tractor-trailer: 69%
Fuel Economy of Tractor Trailer Trucks Lowest in Two Decades

## Tractor Trailers Trucks Dominate Potential Cost-Effective Fuel Savings

<table>

</table>
Technical Summary

• Tractor-trailers are the big fuel users among medium and heavy trucks, consuming two-thirds of all truck fuel, or 1.5 million barrels per day in 2000.

• Substantial improvements could be made to tractor-trailer fuel economy through a variety of existing and emerging technologies, including engine improvements, transmission enhancements, and weight reduction.

• NCEP-sponsored research by ACEEE found that average fuel economy for new tractor-trailers could be raised by 29% starting in 2008 and by 58% in 2015, while providing net savings for the owner based on incremental cost and lifetime fuel savings.
Straw Proposal for Discussion

Congress should direct the U.S. EPA to establish test procedures and gather fuel economy data on heavy-duty tractor-trailer trucks on an annual basis.

• As a starting point, EPA should review existing test procedures, such as those already developed by the private sector through the Society of Automotive Engineers (SAE).
