

2008 Renewable Energy Data Book

Acknowledgments

This report was produced by Rachel Gelman and Steve Hockett, edited by Michelle Kubik, and designed by Stacy Buchanan of the National Renewable Energy Laboratory (NREL). We greatly appreciate the input and reviews received from Jacques Beaudry-Losique, Sunita Satyapal, and Jesse Johnson of the U.S. Department of Energy; and Robert Remick, Fort Felker, Doug Arent, Nate Blair, and Selya Price of NREL.

Key Findings

- Although renewable energy (excluding hydropower) is a relatively small portion of total energy supply both globally and in the United States, **renewable energy installations in both the world and in the United States have nearly tripled between 2000 and 2008.**
- Including hydropower, **renewable energy represents nearly 11% of total installed capacity and more than 9% of total generation in the United States in 2008.**
Installed renewable energy capacity (including hydropower) is 119 gigawatts (GW).
Not including hydropower, 2008 renewable electricity installed capacity has reached about 42 GW in the United States.
- In the United States, growth in sectors such as wind and solar photovoltaics (PV) signify an ongoing shift in the composition of our electricity supply. **In 2008, cumulative wind capacity increased by 51% and cumulative solar PV capacity grew 44% from the previous year.**

Key Findings, *continued*

- Worldwide, wind energy is the fastest growing renewable energy technology—**between 2000 and 2008, wind energy generation worldwide increased by a factor of almost 7**. The United States experienced even more dramatic growth, as installed wind energy capacity increased almost 10 times between 2000 and 2008.
- In the United States, renewable energy has been capturing a growing percent of new capacity additions during the past few years. **In 2008, renewable energy accounted for more than 43% of all new grid-connected electrical capacity installations in the United States**—a large contrast from 2004 when all renewable energy captured only 2% of new capacity additions.
- Since 2006, the United States has been the world's leading ethanol producer. **Between 2000 and 2008, production of corn ethanol increased more than 5 times, and biodiesel production increased 350 times**. Use of ethanol in the United States has also grown substantially, and it currently accounts for 6.5% of the total U.S. gasoline pool, up from 1% in 2000.

I. U.S. Energy Background Information

U.S. Energy Production and Consumption (2008)

U.S. Energy Production (2008): 73.7 Quadrillion Btu

U.S. Non-Hydro Renewable Energy Production: 4.9 Quadrillion Btu

U.S. Energy Consumption (2008): 99.3 Quadrillion Btu

U.S. Non-Hydro Renewable Energy Consumption: 4.8 Quadrillion Btu

Source: EIA; full references are provided starting on p. 122.

Note: Because hydropower is considered a conventional source of energy, it is accounted for separate from other new renewable sources of energy. Energy consumption is higher than energy production due to oil imports.

U.S. Energy Production by Energy Source (%) 2000–2008

Source: EIA

Note: Electricity generation from hydro pumped storage is negative because more electricity is consumed than generated by these plants.

Price Range of Renewable Electricity by Technology (2008)

* Average cost will vary according to financing used and the quality of the renewable energy resource available.

Sources: Idaho National Laboratory, Carbon Trust, Simmons Energy Monthly, U.S. DOE-EERE, IEA, Solarbuzz LLC, REN21, LBNL

Capacity Factor for Renewable Resources (2008)

* Concentrating solar power (CSP) reaches the upper part of this range when systems incorporate thermal storage.

** This range is derived from experimental wave installations

II. Renewable Electricity in the U.S.

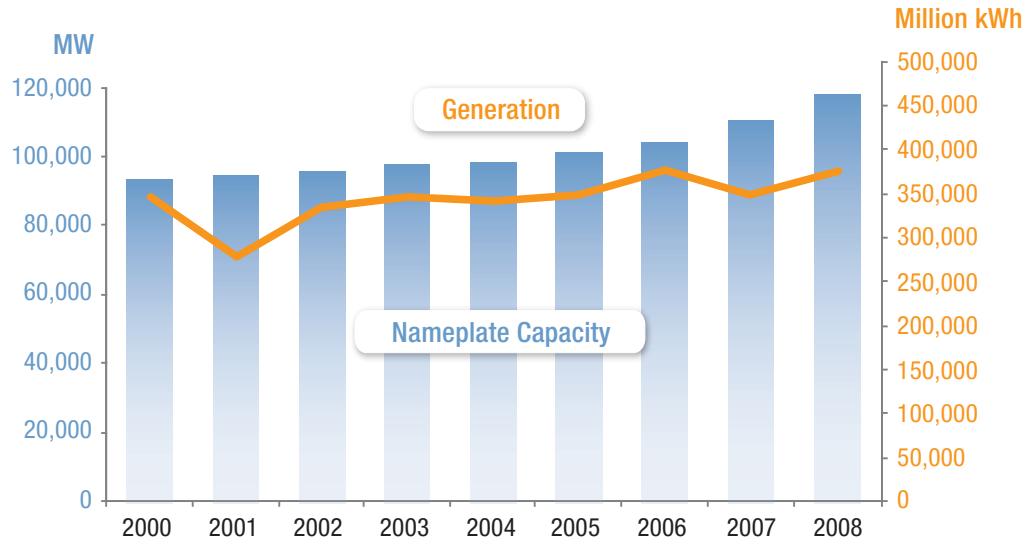

Renewable Electricity in the U.S.: Summary

- Since 2000, renewable electricity installations in the United States (excluding hydropower) have nearly tripled, and in 2008 represent **42 GW of installed capacity**.
- Renewable electricity (excluding hydropower) has grown at a compounded annual average of **12% per year from 2000–2008**.
- Although it is a growing part of U.S. energy supply, renewable electricity (excluding hydropower) in 2008 still represents a small percentage of overall installed electricity capacity (3.8%) and generation (3.1%) in the United States.
- Wind and solar PV are the fastest growing renewable energy sectors. **In 2008, wind capacity installations increased by 51% and solar PV grew 44% from the previous year.**

- In 2008, **biomass** produced about **45% of total renewable electricity generation** (excluding hydropower).
- **Wind energy** accounted for about **93% of total installed renewable electricity capacity** in 2008 (excluding hydropower).
- Electricity generation from biomass, geothermal, and hydropower have remained relatively stable since 2000.

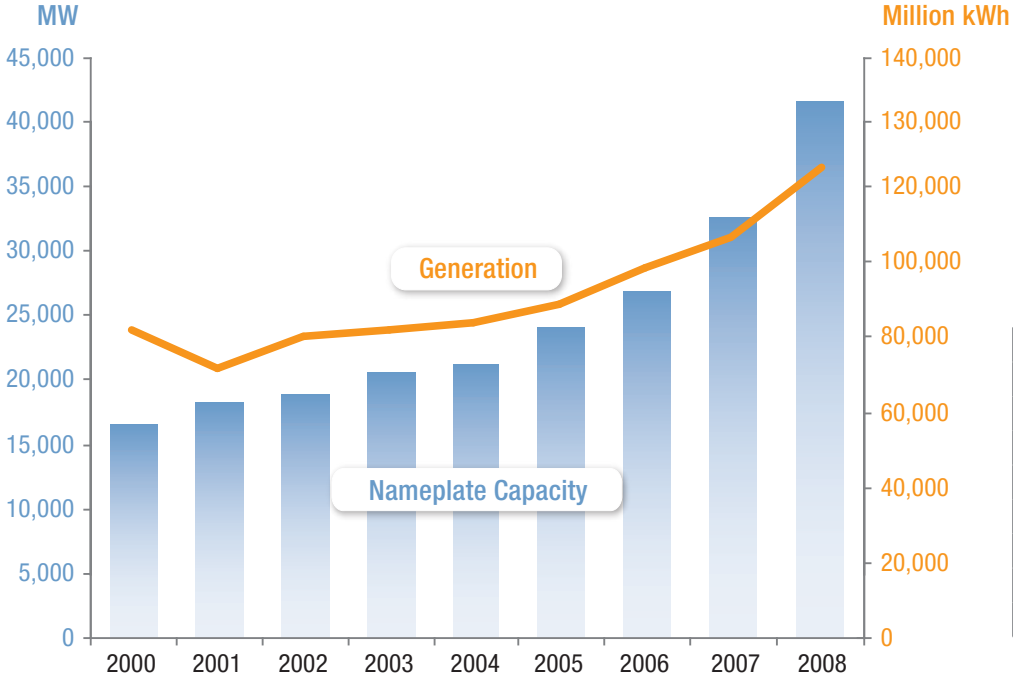

Capacity and Generation: All Renewables (including hydropower)

	Total Nameplate Capacity (MW)	Total Generation (Million kWh)
2000	93,437	356,894
2001	95,026	288,139
2002	95,908	343,904
2003	97,607	355,889
2004	98,352	351,712
2005	101,303	358,428

State Renewable Energy Information: Summary

- In 2008, **Texas advanced over California** as having the most renewable electricity (excluding hydropower) of any U.S. state.
- **Washington is the leader** in installed renewable energy capacity when including hydropower.
- In 2008, **Texas became the national leader** in wind power development.
- A combination of **state incentives and renewable portfolio standards** for renewable energy and renewable resource development has driven renewable growth in some states.

III. Global Renewable Energy Development

Global Renewable Energy Development: Summary

- Global renewable electricity installations (excluding hydropower) have **more than tripled** from 2000–2008.
- Including hydropower, renewable energy accounts for **18%** of all global electricity generation; without hydropower, renewable energy accounts for **2.5%** of global generation.
- Wind energy is the fastest growing renewable energy technology worldwide, and its generation **grew by a factor of almost 7** between 2000 and 2008.
- In 2008, Germany led the world in cumulative solar PV installed capacity. The United States leads the world in wind, geothermal, biomass, and CSP installed capacity.

Does not include large hydropower capacity.

** Majority of China's renewable energy is from small hydropower.

Top Countries with Installed Renewable Electricity by Technology (2008)

IV. Wind

Wind: Summary

- In the United States, wind energy installed capacity **increased almost 10 times between 2000 and 2008**, and it is the fastest growing renewable electricity technology.
- In the United States, wind experienced record growth in 2008 and **more wind capacity was installed in 2008 than in 2006 and 2007 combined**. Texas led the United States in wind installations in 2008, installing more than 2,671 MW of wind capacity.
- The average price of wind power, including the production tax credit, was about **4 cents per kilowatt hour in 2008**—a price that competes with fossil fuel-generated electricity.
- In 2008, the United States surpassed Germany as the world leader in installed wind capacity.
- Indiana and Michigan both made significant investments in wind energy. Each added about 130 MW in 2008 to a base of fewer than 5 MW.

U.S. Total Installed Wind Energy Nameplate Capacity and Generation

IV

	U.S. Wind Energy Generation (Million kWh)	U.S. Wind Energy Capacity and Percent Increase from Previous Year	
		Total (MW)	% Increase
2000	5,593	2,578	2.6%
2001	6,737	4,275	65.8%
2002	10,354	4,686	9.6%
2003	11,187	6,353	35.6%
2004	14,144	6,725	5.9%
2005	17,811	9,121	35.6%
2006	26,589	11,575	26.9%
2007	34,450	16,824	45.3%
2008	52,026	25,369	50.8%

U.S. Wind Power Sales Price

IV

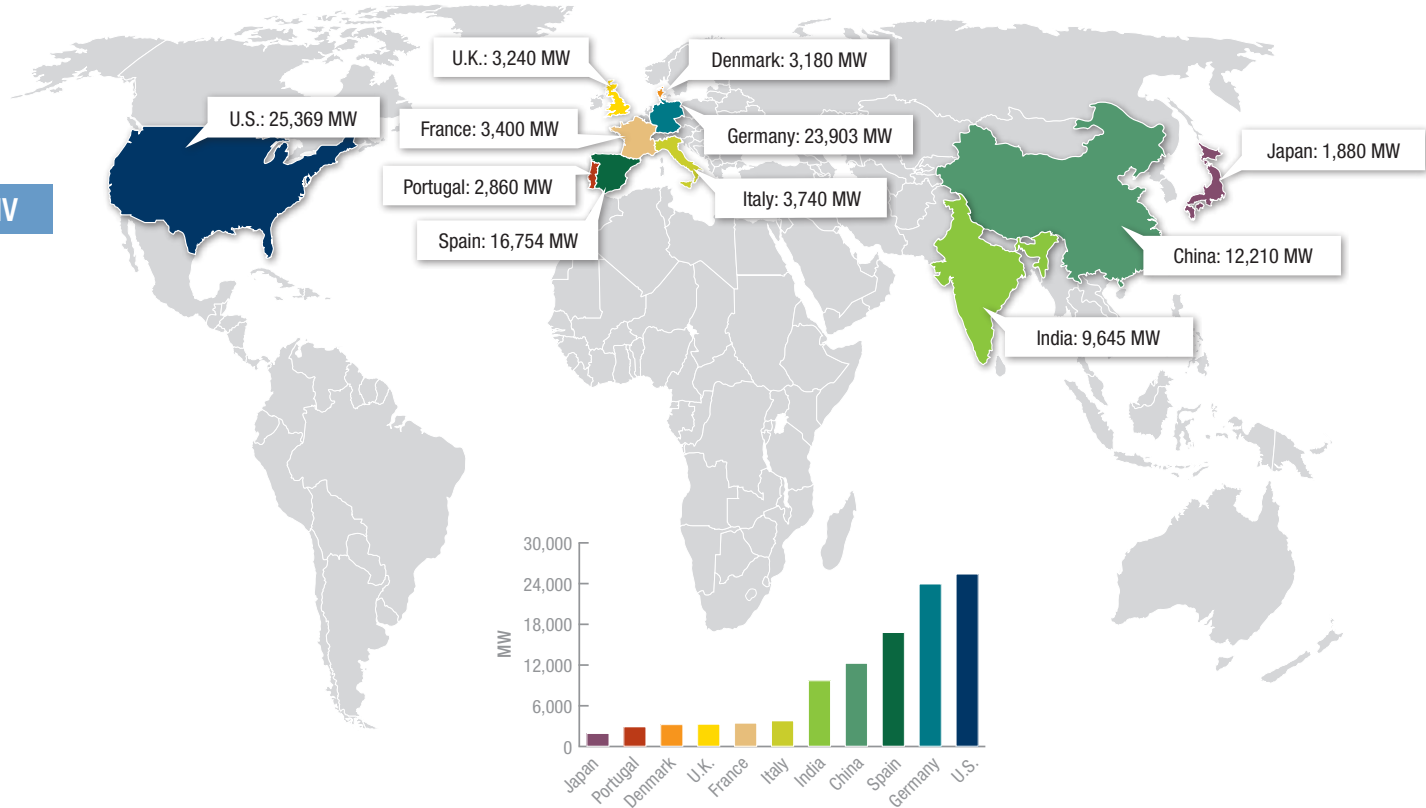

Sources: EERE, LBNL

Note: Prices reflect cumulative capacity-weighted average wind power prices and include state and federal incentives in the price.

The recent increase in wind power price is due to increased demand for turbines coupled with global increases in prices for steel, cement, copper, and other commodity materials.

V. Solar

Solar: Summary

- Solar energy electricity generation has **more than tripled between 2000 and 2008**, but still represents a very small part of overall U.S. electricity generation.
- Countries with aggressive solar policies—such as Germany, Spain, and Japan—lead the world in solar photovoltaic (PV) deployment. Similarly, **U.S. states with aggressive solar incentives lead the United States in installations** (California, New Jersey, Nevada, and Colorado).
- U.S. manufacturers currently have a **small share of the world PV market**. Q-cells (based in Germany) is currently the market leader with 8.2% of the global PV market.
- Although no concentrating solar power (CSP) plants came online in 2008, there are **currently about 80 MW of CSP** under construction or with financing secured.

VI. Geothermal

Geothermal: Summary

- U.S. geothermal energy generation has remained relatively stable from 2000 to 2008, with the **past two years experiencing more than 3% growth.**
- Geothermal energy generates power for **between 6 and 10 cents / kilowatt-hour.**
- **The United States leads the world in terms of installed geothermal electricity capacity and generation,** with most of that power installed in California.
- As a base-load source of energy, geothermal is distinct from other renewables such as wind and solar, because **it can provide electricity 24 hours a day, 365 days a year.**

VI

VII. Biopower

Biopower: Summary

- Biopower generation has remained steady during the past seven years, and currently accounts for **45% of all renewable energy generated in the United States** (excluding hydropower).
- Biomass electricity primarily comes from wood and agricultural residues that are burned as a fuel for cogeneration in the industrial sector (such as in the pulp and paper industry).

U.S. Biopower Nameplate Capacity and Generation

VII

	U.S. Biopower Generation (Million kWh)	U.S. Biopower Capacity and % Increase from Previous Year	
		Total (MW)	% Change
2000	60,726	10,676	- 2.9%
2001	49,748	10,576	- 0.9%
2002	53,709	10,867	2.8%
2003	53,340	10,856	- 0.1%
2004	53,073	11,033	1.6%
2005	54,160	11,222	1.7%

Note: LFG stands for Landfill Gas and MSW stands for Municipal Solid Waste

Note: The generation decrease between 2000 to 2001 reflects an EIA classification change. Beginning with 2001 data, non-biogenic Municipal Solid Waste and tire-derived fuels were reclassified as non-renewable energy sources (previously considered waste biopower).

VIII. Hydropower

Hydropower: Summary

- Hydropower **capacity has remained constant between 2000–2008**, with generation fluctuation depending on water supply.
- Hydropower remains the largest source of renewable energy generation, and an important component of the energy mix; primarily large-scale hydropower **accounts for 6% of U.S. electricity generation.**

IX. Advanced Water Power

Advanced Water Power: Summary

- U.S. interest in advanced water power—such as **tidal, river** and **ocean current**, and **ocean wave** energy—is just beginning to grow, with many prototype projects in testing stages and permits being filed at the Federal Energy Regulatory Commission (FERC).
- In fiscal year 2008, the Congress appropriated **\$10 million to DOE for water power research and development.**

X. Hydrogen

Hydrogen: Summary

- As of May 2009, there are approximately **60 hydrogen fueling stations** in the United States.
- Approximately **34,000 fuel cell units have been delivered globally**; more than 8,500 units were shipped in 2007 for stationary, portable, and transport applications.
- More than 200 vehicles have been demonstrated in the United States to date, with major automakers starting to lease vehicles.
- Global public R&D investment for hydrogen is **~\$1 billion/year worldwide**, with more than \$400 million in the United States.

Hydrogen – Electricity

Stationary Fuel Cell Installations (2008)

XI. Renewable Fuels

Renewable Fuels – Ethanol: Summary

- Corn ethanol production continues to expand rapidly in the United States. **Between 2000 and 2008, production increased 5.5 times.**
- Ethanol production **grew more than 38% in 2008** to reach **9,000 million gallons** per year.
- Ethanol has steadily increased its percentage of the overall gasoline pool, and in 2008 was estimated to be **6.5%**.
- In 2008, the United States* produced 51.9% of the world's ethanol, followed by Brazil at 37.3%, the European Union at 4.2%, China at 2.9%, and Canada at 1.4%.

* All U.S. ethanol is currently produced from corn (in contrast to Brazil's ethanol coming from sugar cane); but efforts are underway by the U.S. Department of Energy and others to commercialize cellulosic ethanol, which is produced from non-food crops.

Note: Ethanol is blended with gasoline and generally comprises up to 10% of the fuel with gasoline as the other 90% (E10). Additionally, flex-fuel vehicles use a blend of 85% ethanol and 15% gasoline (E85).

U.S. Corn Ethanol Production and Price Trends

XI

U.S. Ethanol Production and Growth in Gasoline Pool by Volume

	Gasoline Pool* (Million gallons/yr)	Ethanol Production (Million gallons/yr)	Annual Growth (%)	Percent of gasoline pool
2000	128,662	1,630	11%	1.3%
2001	129,312	1,770	9%	1.4%
2002	132,782	2,130	20%	1.6%
2003	134,089	2,800	31%	2.1%
2004	137,022	3,400	21%	2.5%
2005	136,949	3,904	15%	2.9%
2006	138,378	4,855	24%	3.5%
2007	142,287	6,500	34%	4.6%
2008	137,414	9,000	39%	6.5%

U.S. Ethanol Distribution and Utilization

1,877 E85 stations (May 2009)

E85 average retail price (Oct. 2008):
\$3.99/gallon (energy-equivalent basis),
gasoline price: \$3.04/gallon

**Approximately 7.5 million flex-fuel
vehicles (FFV)** are on the road, with
790,000 of those built in 2007

XI

* Includes ethanol

U.S. Ethanol Production Capacity and Ethanol Yields and Emissions

Top Five States 2008 for U.S. Ethanol (operating) Production Capacity (millions of gallons)	
1 Iowa	2,856
2 Nebraska	1,164
3 Illinois	1,190
4 Minnesota	838
5 South Dakota	799

	Yields (gallons/acre)	GHG Emissions* (% less than gasoline)
Corn	330	22%
Sugarcane	600-800	56%
Cellulosic	>1,000	91%

* In terms of lbs/gallon produced for production and use of fuel

Note: No sugarcane ethanol is currently produced in the United States.

Sources: RFA, EIA, National Geographic, Cornell University

U.S. Ethanol Production Capacity

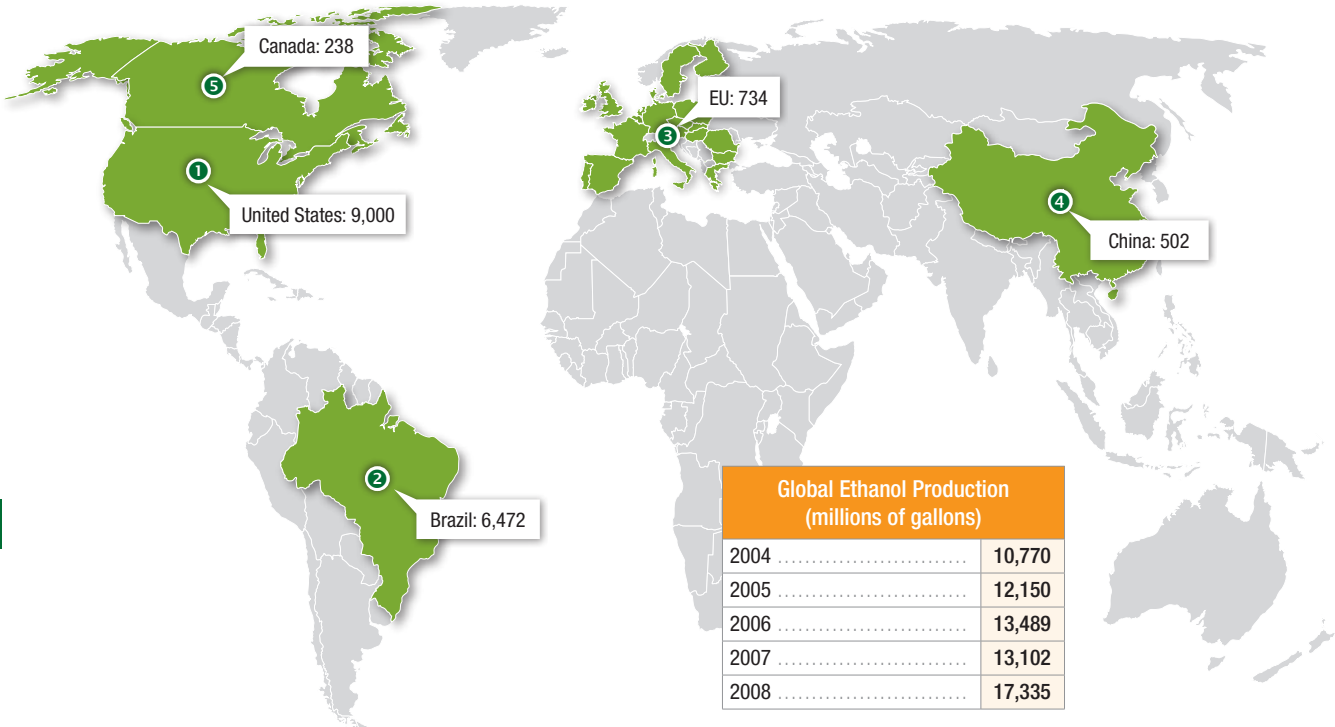

Total U.S. Ethanol Operating Production Capacity (2008): 10,569.4 million gallons/year (mmgy)

Top Five Ethanol Companies —Production Capacity 2008 (millions of gallons/year)	
1 Poet	1,419
2 Archer Daniels Midland Co.	1,070
3 VeraSun Energy	450
4 US BioEnergy Corp.	445
5 BioFuel Energy	230

Note: On March 31, 2008, VeraSun Energy merged with US BioEnergy Corporation.

Global Ethanol Production

Top Five Countries (2008) Ethanol Production (millions of gallons)

Global Ethanol Production (millions of gallons)	
2004	10,770
2005	12,150
2006	13,489
2007	13,102
2008	17,335

XI

Renewable Fuels – Biodiesel: Summary

- Biodiesel has expanded from a relatively small production base in 2000, to a total U.S. production of **700 million gallons** in 2008.
- Biodiesel production in 2008 is **350 times** what it was in 2000.
- Europe leads the world in biodiesel production, with most production and consumption in Germany.

U.S. Biodiesel Demand and Price (2000–2008)

	Annual Growth	Total Production (thousand gallons)
2000	300%	2,000
2001	150%	5,000
2002	200%	15,000
2003	33%	20,000
2004	25%	25,000
2005	200%	75,000
2006	233%	250,000
2007	100%	500,000
2008	40%	700,000

XI

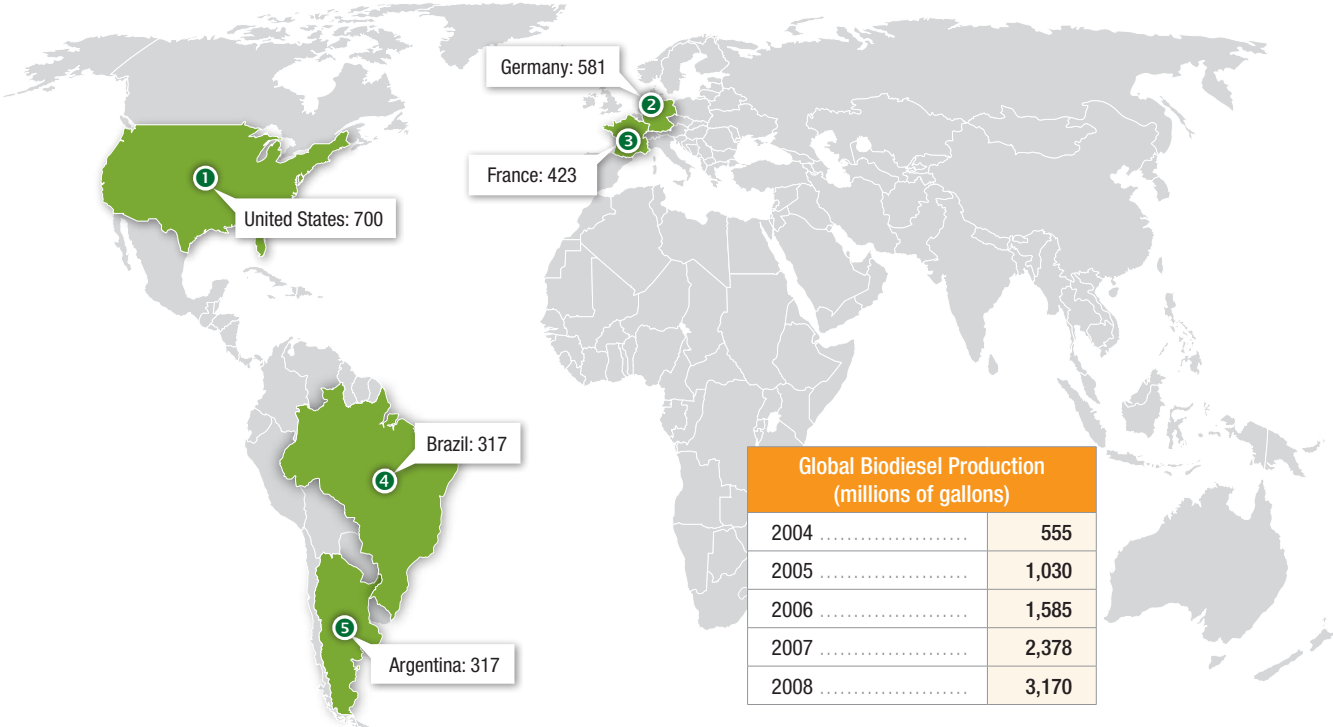

U.S. Biodiesel Production Capacity

Total U.S. Biodiesel Production Capacity (2008): 2,610 million gallons/year (mmgy)

Top Six Biodiesel Companies — Production Capacity 2008 (millions of gallons/year)	
1 Green Hunter Biofuels	105
2 Imperium Grays Harbor	100
3 Green Earth Fuels of Houston	90
4 ADM	85
5 Delta Biofuels	80
6 Louis Dreyfus Agricultural Industries	80

Global Biodiesel Production

Top Five Countries (2008) Biodiesel Production (millions of gallons)

XI

XII. Clean Energy Investments

Clean Energy Investments: Summary

- U.S. investment in renewable energy projects has grown dramatically in the past decade, and in 2008 investment reached more than **\$23 billion**. In the last quarter of 2008, U.S. investment declined by more than 30% compared to the previous quarter, reflecting the overall economic decline.
- U.S. investment in wind energy projects grew from \$250 million in 2001 to **almost \$12 billion in 2008**.
- In 2008, U.S. venture capital and private equity investment in renewable energy technology companies was **\$3.9 billion**—up from \$30 million in 2001.
- U.S. venture capital and private equity investment in solar technology companies has increased from \$5 million in 2001 to more than **\$2 billion** in 2008.

U.S. and Global Total Investment in Renewable Energy, 2008 (\$ millions)

U.S. Total Investment

Global Total Investment

Public Renewable Energy Index Performance, 2008 (Indexed to 100)

Glossary

Base-load capacity

The generating equipment normally operated to serve loads on an around-the-clock basis.

Biodiesel

Any liquid biofuel suitable as a diesel fuel substitute or diesel fuel additive or extender. Biodiesel fuels are typically made from oils such as soybeans, rapeseed, or sunflowers; or from animal tallow. Biodiesel can also be made from hydrocarbons derived from agricultural products such as rice hulls.

Biofuels

Liquid fuels and blending components produced from biomass (plant) feedstocks, used primarily for transportation.

Biomass

Organic non-fossil material of biological origin constituting a renewable energy source.

British Thermal Unit (Btu)

The quantity of heat required to increase the temperature of 1 pound of liquid water by 1 degree Fahrenheit at the temperature at which water has its greatest density (approximately 39 degrees Fahrenheit).

Capacity Factor

The ratio of the electrical energy produced by a generating unit for the period of time considered to the electrical energy that could have been produced at continuous full power operation during the same period.

Compound Annual Growth Rate

The year-over-year growth rate applied during a multiple-year period. The formula for calculating CAGR is $(\text{Current Value}/\text{Base Value})^{(1/\# \text{ of years})} - 1$.

Concentrating Solar Power (CSP)

A solar energy conversion system characterized by the optical concentration of solar rays through an arrangement of mirrors to heat working fluid to a high temperature. Concentrating solar power (but not solar thermal power) may also refer to a system that focuses solar rays on a photovoltaic cell to increase conversion efficiency.

Cost

The amount paid to produce a good or service. Cost represents the sum of the value of the inputs in production

Direct Use

Use of electricity that (1) is self-generated, (2) is produced by either the same entity that consumes the power or an affiliate, and (3) is used in direct support of a service or industrial process located within the same facility or group of facilities that house the generating equipment. Direct use is exclusive of station use.

E85

A fuel containing a mixture of 85 percent ethanol and 15 percent gasoline.

Glossary

Ethanol

A clear, colorless, flammable oxygenated hydrocarbon. Ethanol is typically produced chemically from ethylene, or biologically from fermentation of various sugars from carbohydrates found in agricultural crops and cellulosic residues from crops or wood. It is used in the United States as a gasoline octane enhancer and oxygenate (blended up to 10 percent concentration). Ethanol can also be used in high concentrations (E85) in vehicles designed for its use.

Federal Energy Regulatory Commission (FERC)

The federal agency with jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification. FERC is an independent regulatory agency within the Department of Energy (DOE) and is the successor to the Federal Power Commission.

Flexible-Fuel Vehicles

Vehicles that can operate on (1) alternative fuels (such as E85); (2) 100 percent petroleum-based fuels; (3) any mixture of an alternative fuel (or fuels) and a petroleum-based fuel. Flexible-fuel vehicles have a single fuel system to handle alternative and petroleum-based fuels.

Fuel Cell

A device capable of generating an electrical current by converting the chemical energy of a fuel (e.g., hydrogen) directly into electrical energy. Fuel cells differ from conventional electrical cells in that the active materials such as fuel and oxygen are not contained within the cell but are supplied from outside. It does not contain an intermediate heat cycle, as do most other electrical generation techniques.

Gasoline Pool

All gasoline produced by volume, including any additions such as ethanol or methyl tertiary-butyl ether (MTBE).

Generation

The total amount of electric energy produced by generating units and measured at the generating terminal in kilowatt-hours (kWh) or megawatt-hours (MWh).

Geothermal Energy

The heat that is extracted from hot water or steam that is mined from geothermal reservoirs in the earth's crust. Water or steam can be used as a working fluid for geothermal heat pumps, water heating, or electricity generation, and then is reinjected back into the earth.

Geothermal Heat Pump

A heat pump in which the refrigerant exchanges heat (in a heat exchanger) with a fluid circulating through an earth connection medium (ground or ground water). The fluid is contained in a variety of loop (pipe) configurations depending on the temperature of the ground and the ground area available. Loops may be installed horizontally or vertically in the ground or submersed in a body of water.

Glossary

Gigawatt (GW)

One billion watts or one thousand megawatts.

Gigawatt-hour (GWh)

One billion watt-hours.

Incremental Capacity

Capacity added on an annual basis.

Insolation

The amount of radiation from the sun received at the surface of the Earth in a particular geographic location or region.

Kilowatt (kW)

One thousand watts.

Kilowatt-hour (kWh)

A measure of electricity defined as a unit of work or energy, measured as 1 kilowatt (1,000 watts) of power expended for 1 hour. One kWh is equivalent to 3,412 Btu.

Landfill Gas

Gas that is generated by decomposition of organic material at landfill disposal sites. The average composition of landfill gas is approximately 50% methane and 50% carbon dioxide and water vapor by volume. The methane in landfill gas may be vented, flared, or combusted to generate electricity or useful thermal energy on-site, or injected into a pipeline for combustion off-site.

Levelized Cost

The present value of the total cost of building and operating a generating plant over its economic life, converted to equal annual payments. Costs are levelized in real dollars (i.e., adjusted to remove the impact of inflation).

Megawatt (MW)

One million watts of electricity.

Megawatt-hour (MWh)

One thousand kilowatt-hours or 1 million watt-hours.

Municipal Solid Waste (MSW)

Residential solid waste and some nonhazardous commercial, institutional, and industrial wastes.

Nameplate Capacity

The maximum rated output of a generator under specific conditions designated by the manufacturer. Nameplate capacity is usually indicated in units of kilovolt-amperes (kVA) and in kilowatts (kW) on a nameplate physically attached to the generator.

Ocean Energy

Energy conversion technologies that harness the energy in tides, waves, and thermal gradients in the oceans.

Photovoltaic (PV) Cell

An electronic device consisting of layers of semiconductor materials fabricated to form a junction (adjacent layers of materials with different electronic characteristics) and electrical contacts and being capable of converting incident light directly into electricity (direct current).

Glossary

Price

The amount paid to acquire a good or service.

Pumped-Storage Hydroelectric Plant

A plant that usually generates electric energy during peak load periods by using water previously pumped into an elevated storage reservoir during off-peak periods when excess generating capacity is available to do so. When additional generating capacity is needed, the water can be released from the reservoir through a conduit to turbine generators located in a power plant at a lower level.

Renewable Energy Resources

Energy resources that are naturally replenishing but flow-limited. They are virtually inexhaustible in duration but limited in the amount of energy that is available per unit of time. Renewable energy resources include: biomass, hydro, geothermal, solar, wind, ocean thermal, wave action, and tidal action.

Solar Thermal Collector

A device designed to receive solar radiation and convert it to thermal energy. Normally, a solar thermal collector includes a frame, glazing, and an absorber, together with appropriate insulation. The heat collected by the solar collector may be used immediately or stored for later use. Solar collectors are used for space heating; domestic hot water heating; and heating swimming pools, hot tubs, or spas.

Thermoelectric Power Plant

A term used to identify a type of electric generating station, capacity, capability, or output in which the source of energy for the prime mover is heat.

Wind Energy

Kinetic energy present in wind motion that can be converted to mechanical energy for driving pumps, mills, and electric power generators.
