

# FutureGen

## Technologies for Carbon Capture and Storage and Hydrogen and Electricity Production

Office of Fossil Energy  
U. S. Department of Energy  
Washington, DC  
June 2, 2003

Lowell Miller, Director, Office of Coal & Power Systems

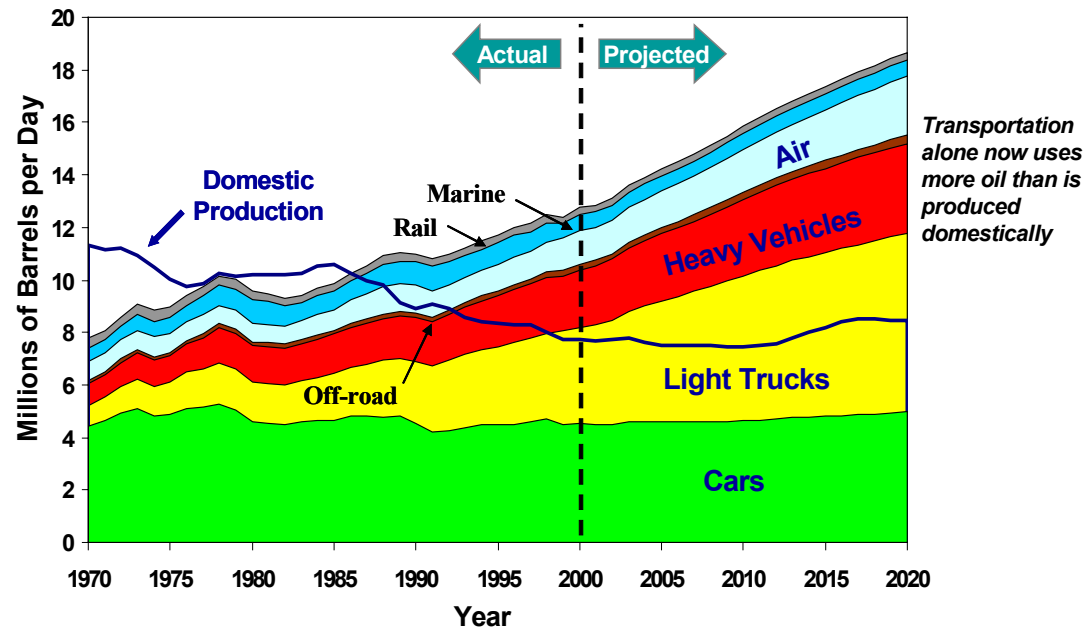

# Presentation Agenda

- FE Hydrogen Program
- FutureGen
- Carbon Sequestration Leadership Forum (CSLF)

# Key Drivers

- Decreasing domestic supply will lead to increased imports from less stable regions
- Conventional petroleum is finite; production will peak and irreversibly decline due to continually increasing demand
- Improving environmental quality
  - Meeting air emission regulations
  - Greenhouse gas emissions

Source: [Transportation Energy Data Book: Edition 21](#), DOE/ORNL-6966, September 2001, and [EIA Annual Energy Outlook 2002](#), DOE/EIA-0383(2002), December 2001

# Tomorrow's Hydrogen

## Why is Hydrogen from Coal Important?

- 95% of U.S. hydrogen comes from natural gas;
- Future “Hydrogen Economy” must have more diversified sources;
- Over longer term, hydrogen will likely come from renewables, nuclear power, fusion, etc.

### But coal can also be a major feedstock:

- Most abundant U.S. fossil fuel (250-yr supply)
- Can be environmentally clean source of hydrogen
- Coal-to-hydrogen costs must be lowered and affordable methods developed to sequester the “left behind” carbon

# Tomorrow's Energy Plant

## Converting Coal into Gas is Key

- 99%+ of Clear Skies pollutants (sulfur/nitrogen/mercury) can be cleaned from gasified coal;
- Hydrogen is a primary product;
- Carbon gases are in concentrated form for easier capture and sequestration.

→ **Hydrogen + Carbon Gases ( $\text{CO}_2$ ,  $\text{CO}$ )**

No coal-to-gas plant in the world today is configured to optimize hydrogen production or carbon capture

The prototype plant would be the world's 1<sup>st</sup>

# Key Goals of the Office of Fossil Energy Hydrogen Program

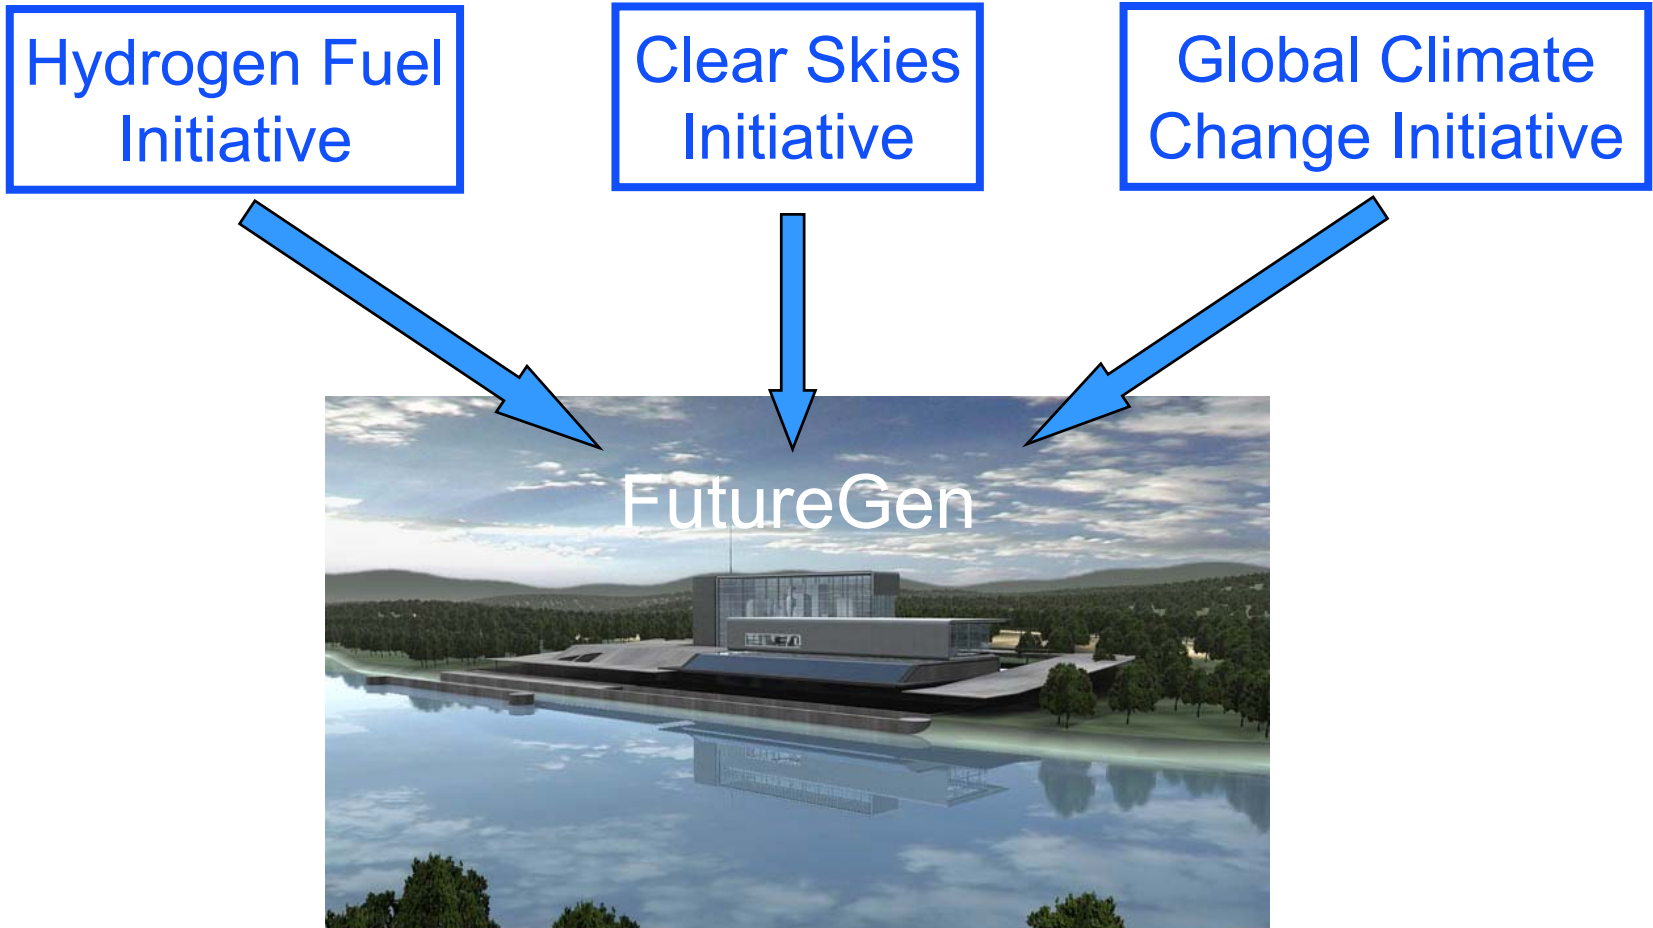

**The goals of the FE Hydrogen Program will drive the budget needs for the program.**

# Vision for Energy Plants of the Future

- Remove environmental concerns associated with the use of fossil fuels for production of electricity, transportation fuels and chemicals through technology
- Characteristics of future energy plants
  - “Near-zero” emissions (coal as clean as gas)
  - CO<sub>2</sub> sequestration ready
  - Flexible (feed stocks, co-products, siting)
  - Highly energy efficient
  - Affordable (competitive with other energy options)
  - Industrial Ecology (waste into by-products)
  - Reduced water requirements
  - Timely deployment of new technology
  - Sustainable

# Confluence of Presidential Initiatives

Integrated Sequestration, Hydrogen  
and Energy Research Initiative

# What is FutureGen?

- **The world's first plant [prototype] to:**
  - Capture and permanently sequester carbon dioxide
  - Emit virtually no air pollutants [zero emissions]
  - Pioneer advanced processes to produce hydrogen from coal
- **FutureGen announced on 27 February 2003**
  - President Bush
  - Energy Secretary Abraham

    - [http://fossil.energy.gov/techline/tl\\_futuregen1\\_print.html](http://fossil.energy.gov/techline/tl_futuregen1_print.html)
    - [http://fossil.energy.gov/events/speeches/03\\_sec\\_futuregen\\_022703.shtml](http://fossil.energy.gov/events/speeches/03_sec_futuregen_022703.shtml)

# Goals of the Project

- **Design, construct and operate a prototype plant that produces electricity and hydrogen with near-zero emissions**
- **Sequester at least 90% of the CO<sub>2</sub> emissions**
- **Prove the effectiveness, safety and permanence of CO<sub>2</sub> sequestration**
- **Establish technology standards and protocols for CO<sub>2</sub> measuring, monitoring and verification**
- **Validate the engineering, economic and environmental viability of advanced coal-based, near-zero emission technologies for commercial readiness in 2015**

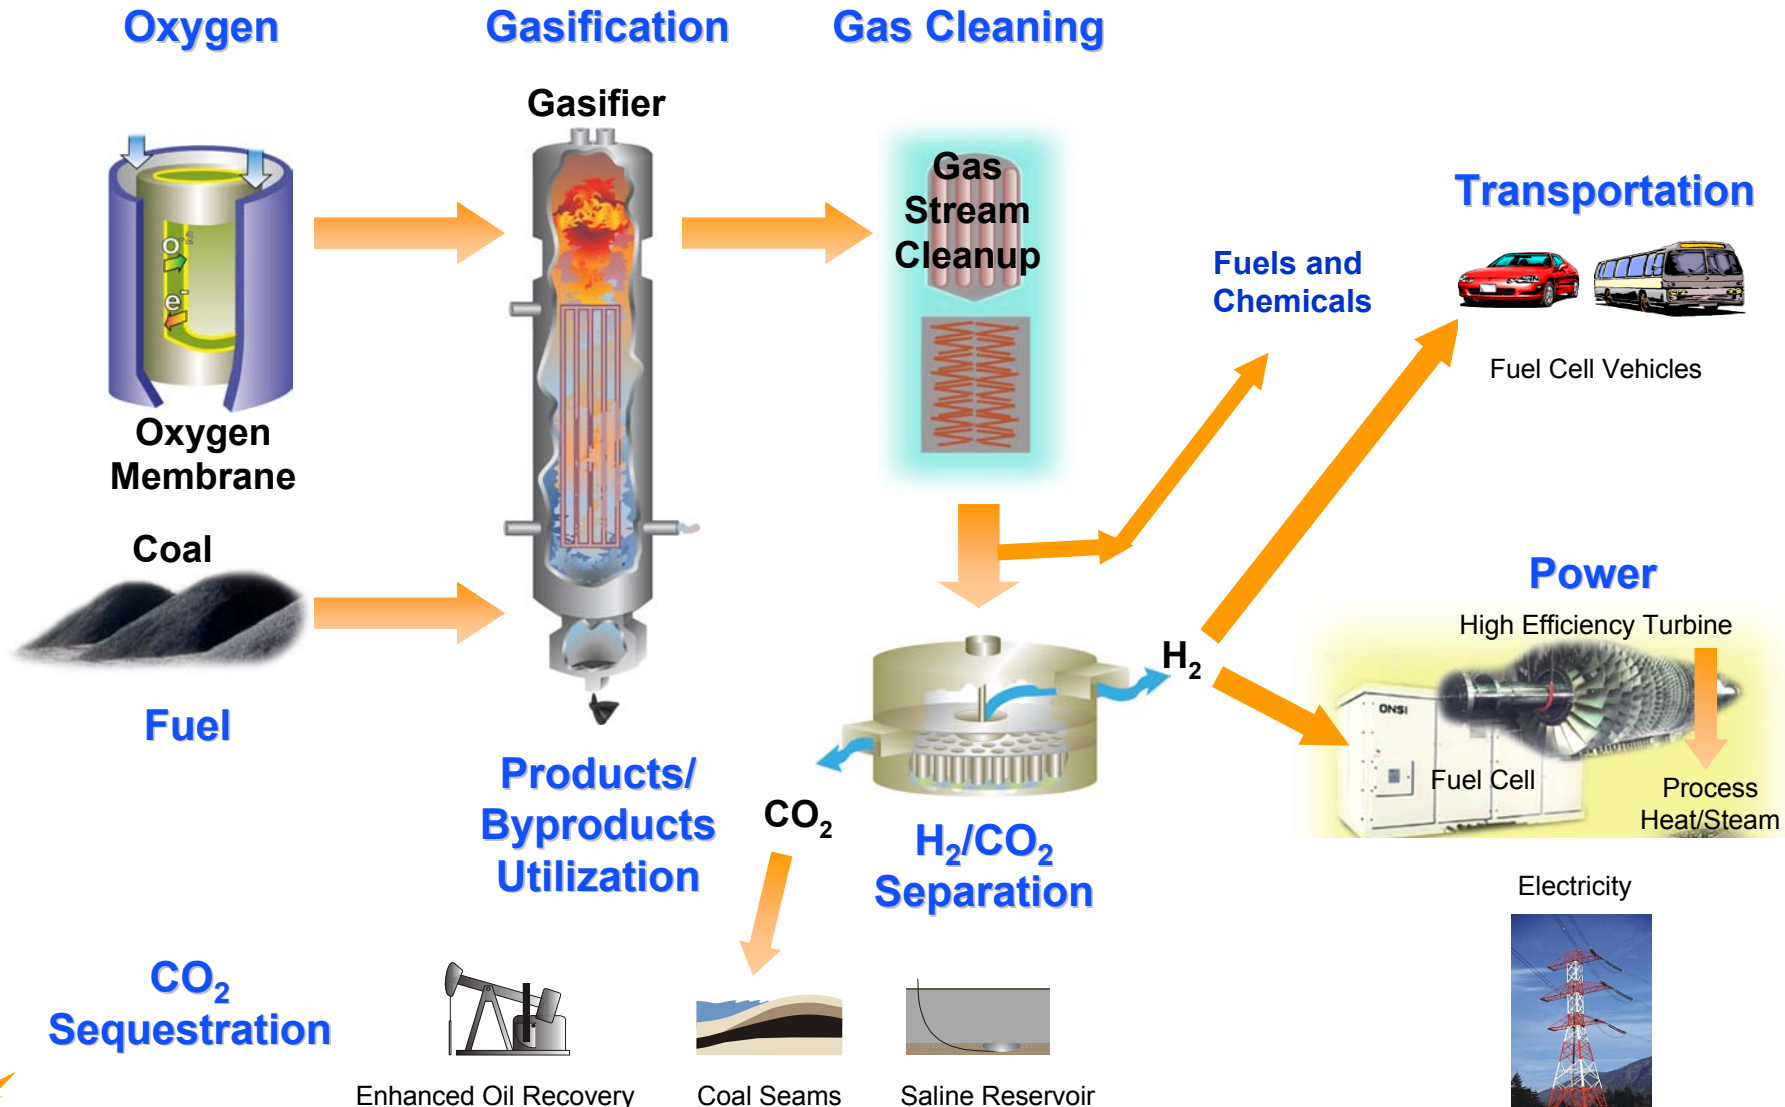

# Features of the Project

- **Coal-fueled gasification process that produces electricity and hydrogen—275 MW<sub>e</sub> [net equivalent output]**
- **Commercial scale of 1 million tons per year of CO<sub>2</sub> captured and sequestered**
- **Total project cost estimated at \$1 billion**
- **Cost-shared by U. S. Department of Energy [maximum 80%] and industry [minimum 20%]**
- **Open to international participation through the Carbon Sequestration Leadership Forum**

# Project Concept

# FutureGen Systems

# FutureGen Process

## Project Definition

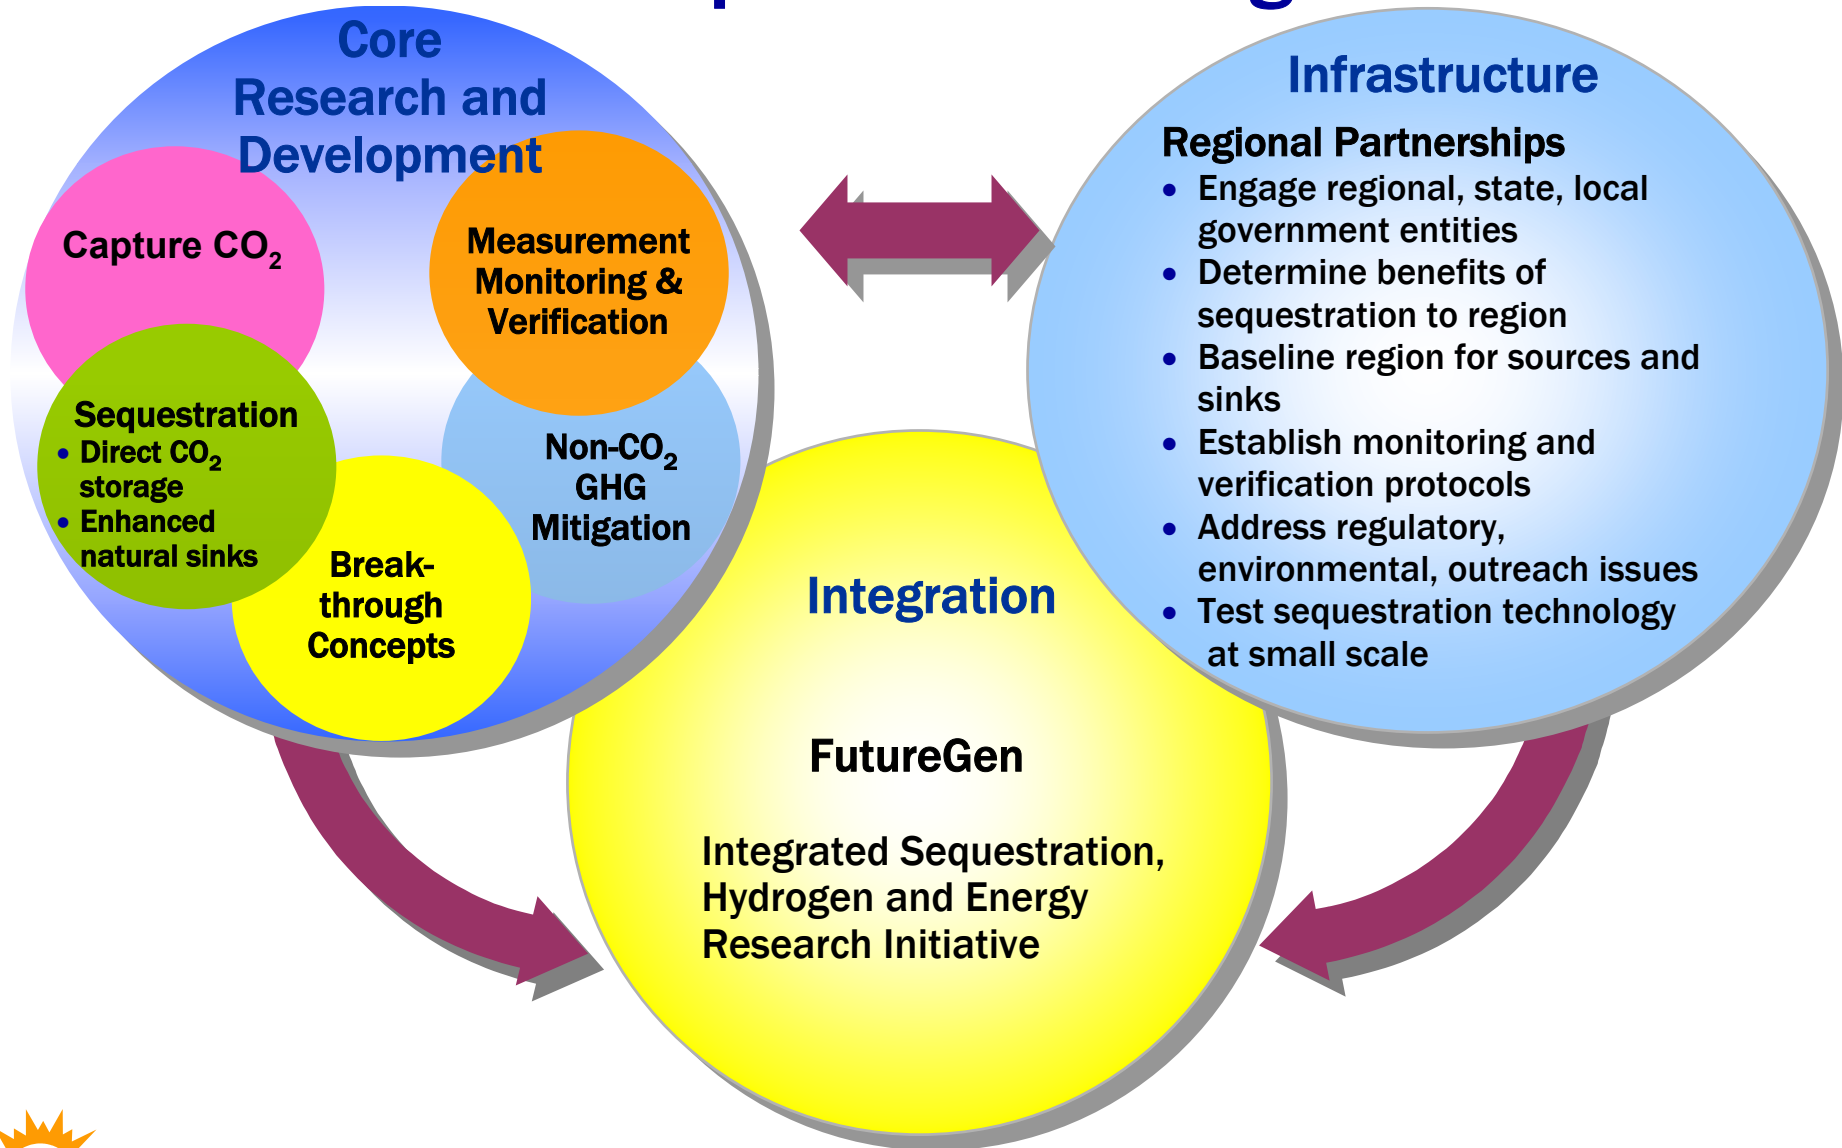

1. Domestic [U.S.]
2. International

## Integration

### FutureGen

- First-of-kind integrated project
- Verify large-scale operation
- Highlight best technology options
- Verify performance and permanence
- Develop cost and performance data
- International showcase

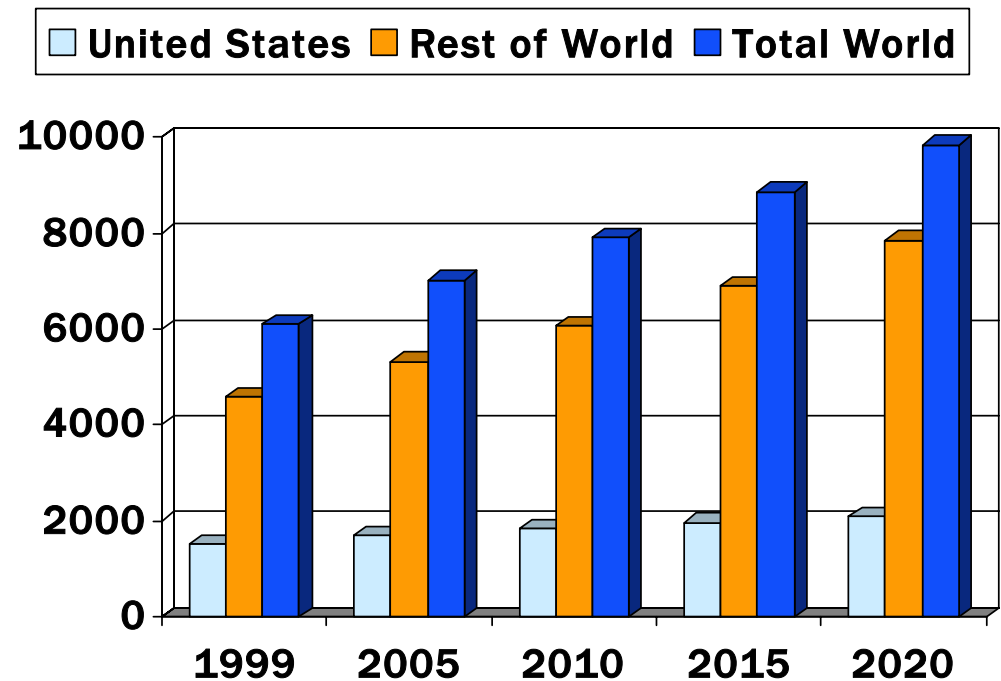

# U. S. Carbon Sequestration Program

# Why Capture CO<sub>2</sub> and Store It?

- Has the potential to remove enough carbon to stabilize CO<sub>2</sub> concentrations in the atmosphere
- Maintains the role of domestic fossil fuel resources in the Nation's energy future for transportation and power generation
- Has the potential to be the lowest cost carbon management option

World CO<sub>2</sub> Emissions  
(Million Metric Tones Carbon Equivalent)

# CO<sub>2</sub> Capture and Storage

## Advanced Concepts

Stable Solids  
Fuels  
Useful Products

Enhanced Oil Recovery

## Geologic Sequestration

Unmineable Coal Beds

Depleted Oil and Gas Reserves

Deep Saline Aquifer

## Ocean Sequestration

### Ocean Disposal of CO<sub>2</sub>

Dissolution	Dispersion	Isolation
1 Dense Plume	3 Towed Pipe	5 CO <sub>2</sub> Lake
2 Droplet Plume	4 Dry Ice	

Deep Saline Aquifer

**Capture and Store < 10% Increase in Cost of Energy**

# Carbon Sequestration Leadership Forum— More Than FutureGen

- **Weyburn CO<sub>2</sub> Enhanced Oil Recovery Project**
  - Validate the capacity, movement and fate of CO<sub>2</sub> used in enhanced oil recovery in Saskatchewan, Canada
- **Sleipner North Sea Project**
  - Norwegian project to strip CO<sub>2</sub> from natural gas extracted from a production well and re-inject the CO<sub>2</sub> into the Utrisa formation – a saline aquifer 1,000 meters underneath the sea bed
- **CO<sub>2</sub> Capture Project**
  - The CO<sub>2</sub> Capture Project is an international effort funded by nine of the world's leading energy companies. This project intends to address the issue of reducing emissions in a manner that will contribute to an environmentally acceptable and competitively priced continuous energy supply for the world

# Example: Weyburn CO<sub>2</sub> EOR Project

- Approximately 650 production and water injection wells on a 70-square mile oil field operated by EnCana Resources.
- A 20-year enhanced oil recovery (EOR) project begun in 2000 using CO<sub>2</sub> from a 200-mile CO<sub>2</sub> pipeline from Dakota Gasification Plant—\$20.5 million cooperative agreement with Canadian Federal and Saskatchewan Provincial Governments. Provides for 130 million barrels of oil and storage of about 20 million metric tons of CO<sub>2</sub> over 20-year lifetime.
- US (DOE), EU, Japan, Alberta Government, private companies (e.g., BP, Chevron-Texaco, etc.) have joined, providing another \$20 million. IEA CO<sub>2</sub> Monitoring and Storage Project coordinated by 20 research organizations in the US, UK, Canada, France, and Italy.

# Example: Sleipner North Sea Project

- CO<sub>2</sub> stripped from natural gas produced at Statoil's Sleipner gas field in the North Sea and injected into a sand layer called the Utsira formation, some 1,000 meters under the sea bed.
- Project, begun in 1996, is the first commercial application of CO<sub>2</sub> storage on deep saline aquifers in the world. At today's production rate, about 1 million metric tons of CO<sub>2</sub> is extracted annually.
- The Saline Aquifer CO<sub>2</sub> Storage (SACS) Project to monitor the injected CO<sub>2</sub> established in 1998, and includes participation from Norway, U.S, EU, The Netherlands, Denmark, UK, Australia, Canada, Japan, and industrial partners.

# Example: CO<sub>2</sub> Capture Project

- Is a joint project comprising nine (PanCanada) of the world's leading energy companies.
- Aims to reduce the cost of CO<sub>2</sub> capture from combustion sources.
- Is developing methods for safely storing CO<sub>2</sub> underground.
- Is working together with governments, NGO's, and other stakeholders to deliver technology that is cost-effective and meets the needs of society.
- CO<sub>2</sub> capture and geologic storage are bridging technologies that will help move society towards cleaner fuels in the future.
- Technologies developed by this project will be used in many different industries and applications around the world.
